THE SPINE REVOLUTION AT OMNI HOSPITALS

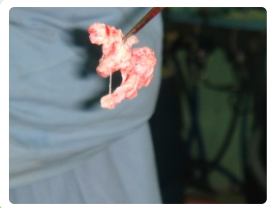

OMNI Hospitals has been in forefront of Spine surgery in our country. Over the past few years a variety of spine surgeries are carried out at OMNI Hospitals which is cost effective and of highest international standards.

The slipped disc

Most of us suffer from low back pain at some point in our life and a few would require surgery for the slipped disc in the lower back. Endoscopic surgery (where small cameras are used), use of microscopes etc. are some of the minimally invasive technologies that are routinely carried out at our centre giving excellent results with relief from pain and rapid return to work. In patients with neck problems decompressions followed by fusion or Cervical disc replacements are done.

Spondylolisthesis

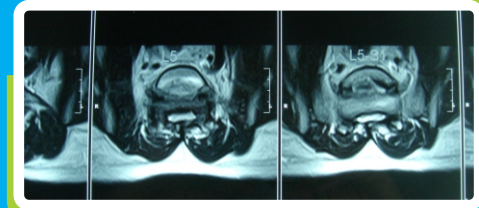

A condition where one vertebra slips forward over the other resulting in pressure over the nerves: With use of pedicle screws and rods even complex and high grade slips are reduced to their anatomical position giving excellent pain relief. Use of

most advanced minimally invasive technology at our spine unit helps in rapid recovery.

Spinal injuries

With ever increasing number of industrial and road traffic accidents

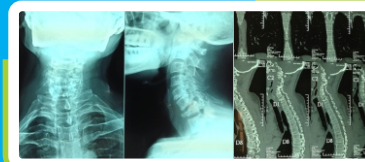

the number of patients with fractures of spine with or without paralysis is increasing. From simple spinal instrumentation surgeries to complex reconstructions of the fractured spine help the patient to sit up the next day. Early mobilization and rehabilitation is done with the help of dedicated physiotherapists.

Fractures of spine in the old age

Fractures of spine due to old age are corrected with techniques such as kyphoplasty and vertebroplasty. These procedures are done under local anaesthesia and patient can be up and about on the same day. Significant instantaneous pain relief is obtained.

The bent and crooked spine

Scoliosis and kyphosis are deformities of spine that can be present at birth or can develop in later life. OMNI Hospitals has been in the forefront of surgical correction of these deformities in the last three decades. From children over a year old to any age, surgical corrections are done with excellent results.

The other disorders

Infections, tumors, cancers of spine and spinal cord are treated with most modern surgical techniques at our institute.
